

Manufacturer's Declaration Wood Preservatives

Wood Preservatives such as Pentachlorophenol (PCP) and Lindane were used for the impregnation of wood and wood-based products in the past. Nowadays, due to their well-known health hazards, they are no longer in use. In the production of particle board and MDF, EGGER does not use wood preservatives.

However, due to the use of post consumer recycling wood in particle board, traces of these pollutants might still occur.

In Austria and Germany, maximum concentrations are limited by law. The German Waste Wood Ordinance and the Austrian Recycling Wood Ordinance define these thresholds.

Regular internal and external tests assure the recycling wood quality in every plant using post consumer recycling material, also in plants not affected by regulations.

We hereby confirm that during the production of EGGER particleboard and MDF board, no wood preservatives are used. If post-consumer recycling material is used in the production, we are testing our boards regularly by external institutes
